

Email Security Anti-Virus

Corpex Email Security Anti-Virus

Corpex's Email Security service offers Anti-Virus and Anti-Spam protection by scanning your emails, inbound and outbound, at the Internet level before they reach you or your recipient's network.

The Anti-Virus service filters your company's email, using a multi-scanner engine to check for known viruses, and in the same instance deploys advanced analytical techniques to search for potential new viruses.

Our Anti-Virus engine uses robust and proven technology, providing maximum protection with no perceptible impact on email delivery speed.

How does it work?

Corpex's Anti-Virus integrated multi-scanner engine uses a combination of multiple commercial Anti-Virus software suites and our own proprietary technology to check for and quarantine any email it identifies or suspects is carrying a virus.

Operating on high performance servers, our scanner deploys various commercial Anti-Virus engines to ensure maximum protection. The emails are then passed through the Anti-Virus proprietary, heuristics based technology, designed and built by our technical team.

The Anti-Virus engine automatically checks for new virus definitions at ten-minute intervals, 24 x 7 x 365. In addition, heuristics based analysis searches for telltale signs of viruses as yet undetected. This means your email is scanned for suspected new viruses rather than being solely reliant on identified virus definitions.

Key features

Simple to set up and no hardware or software required

No perceptible impact on the speed of your company's email

Uses a combination of three leading anti-virus scanners to check for viruses before they reach your network

Searches for tell-tale signs of potential new viruses via heuristics-based analysis

Checks for viruses carried by both incoming and outgoing emails

Automatically checks for new virus definitions at ten minute intervals 24 x 7 x 365

Isolates contaminated messages in a special Quarantine Box for up to 30 days

Sender can instruct Corpex to keep or destroy the infected message

Infected mails can be forwarded if written authority is received from the intended recipient

Subscribers can run an online report at any time to identify the number and sender of any viruses that have threatened their company

Encrypted email is not scanned in order to preserve the encryption

Every scanned email contains a footer certifying that the email has been checked for known viruses
